Invoice Matching Application
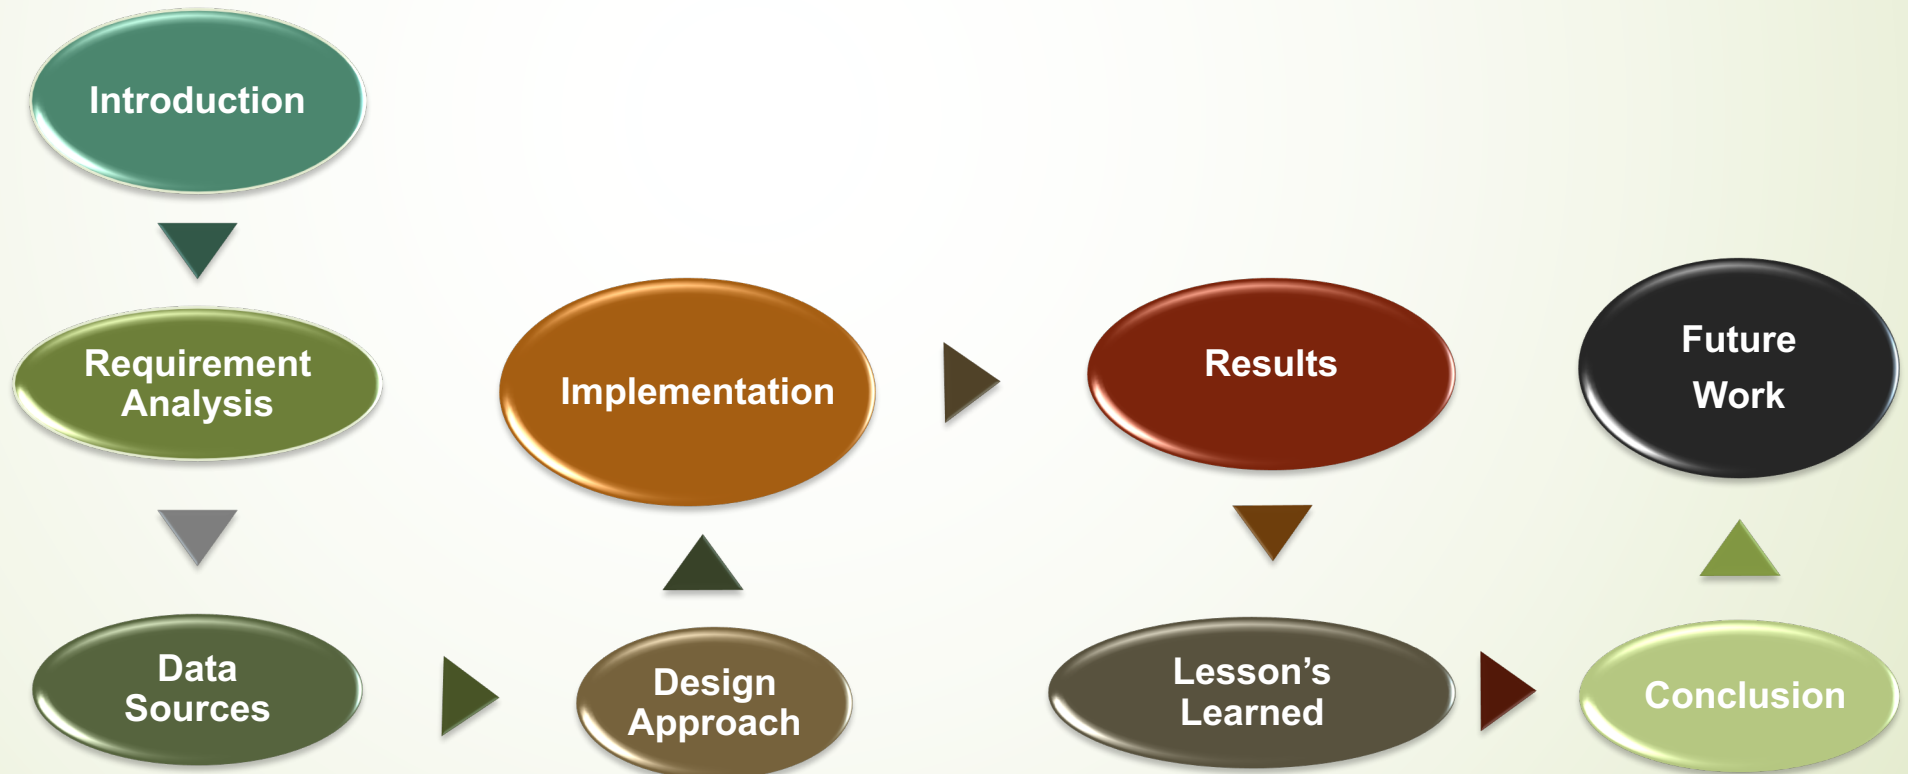

1

- Suresh CHINNA SHANMUGAM

Agenda

- Project Flow – SDLC Life Cycle => Requirements to deployment & Conclusion.
- Functional Flow - Load Input Data-> Invoice Processing -> Matching/Unmatching -> Output Rendering using Python API

Introduction

▶ Invoice Processing

Motivation
- The key focus area is to implementation of Invoice Matching(Processing) Application using Python

Context
- The Process logic, Design Approach, Implementation and test execution, deployment and results validation are key activities to meet the functional requirements.

Problem Statement
- Required to find the list of Invoices/payments and that are matched or Balanced between Debit and Credit amounts, and list the remaining Unmatched records.

Contribution
- Implementation of business process logic using python, database and Flask API

Requirement Analysis

Requirement Analysis

- High level Requirements – To create Matched Invoices with the payment (Types) data based on Debit and credit amounts – The Balanced amounts.

- Technological Specification: Pure Python, API Mode, One backend Table – Hence Opted for MySQL DB to store the required data into Database.

- Meta Data/ Schema for the tables

The Key Requirements from User(Operado)

- Create an instance to feed the table. The video does not show the addition of Invoice, but it will be necessary to envisage it for the continuation

- Filter results based on instance data

- The possibility of associating instances of payment and invoice type when the amount is matching

  - ex : Invoice in the amount of € 20 and a payment of € 2
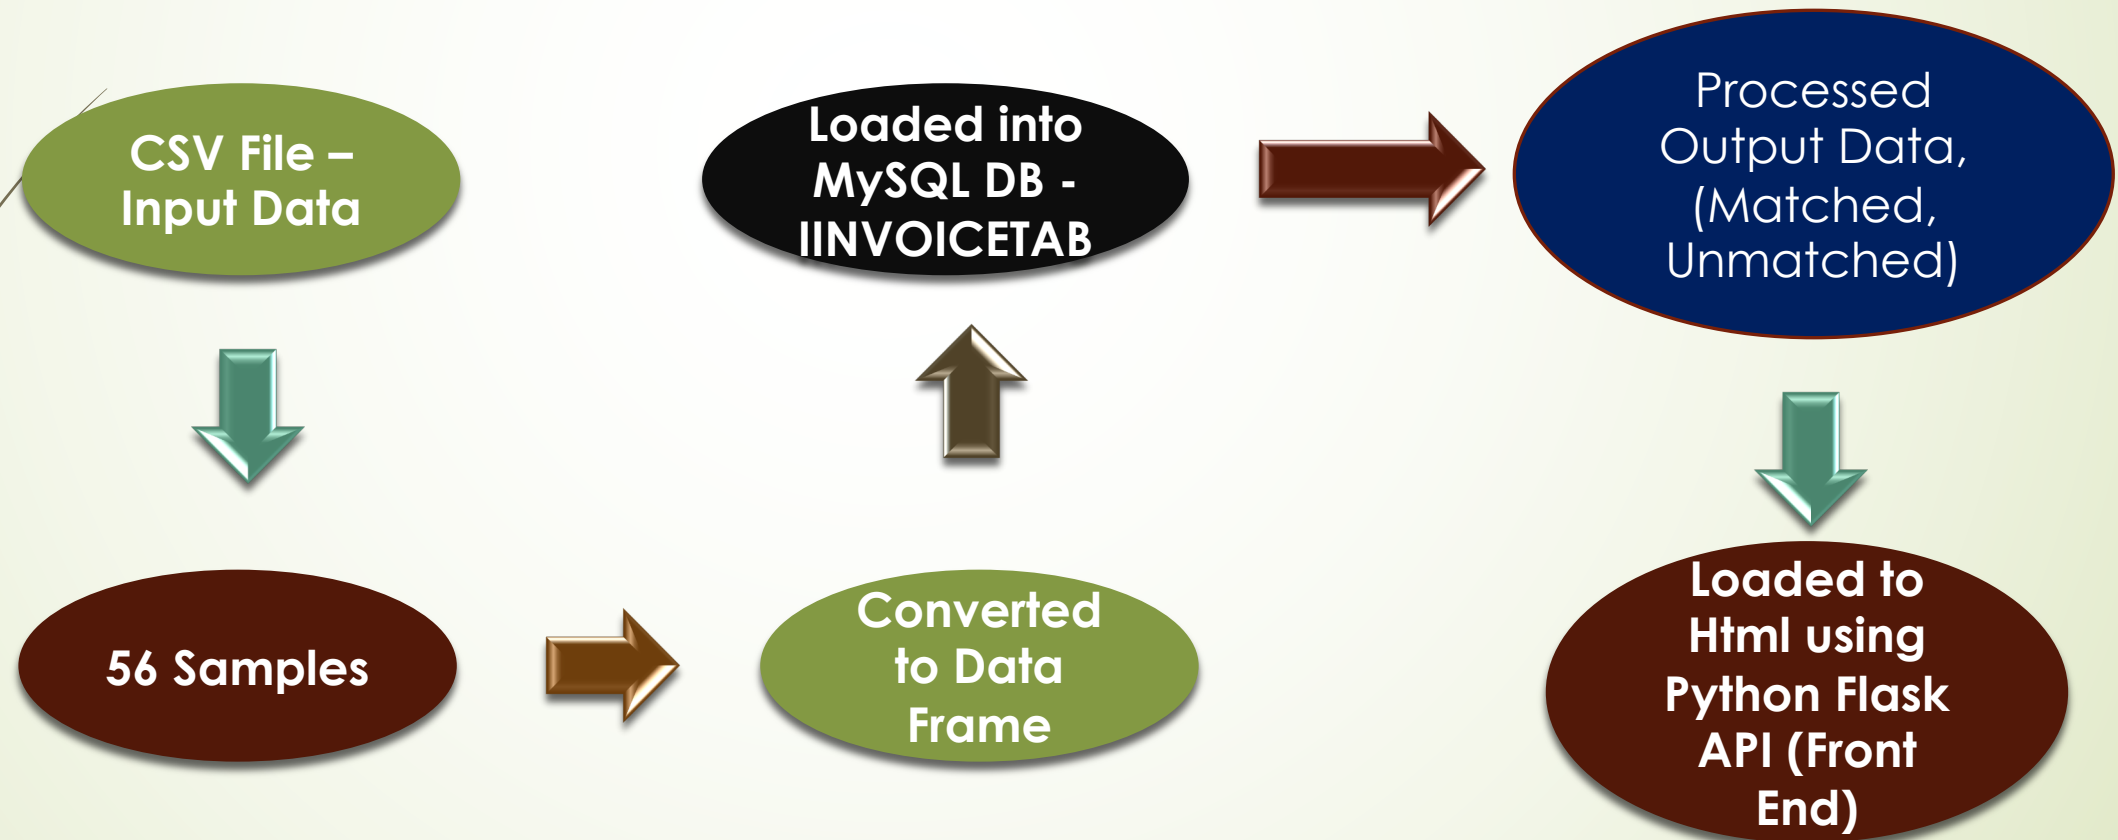

Assumptions:

- NO Specific Data format given, Hence Created CSV file format as input from the Jpeg Sample Data provided by Operado for the current project implementation.

- No Technological Specification to use on Python API – Hence Opted for Python Flask to display the output data in the HTML page from the processed Json Files for all the matched and Invoices invoices

- No Specific requirement on Unmatched records, hence added additional Enhancements

Additional Enhancements:

– Additional Implementation to display All Unmatched Invoices order by Recover (Due, Not Due and Blank)

- Implementation on to display the summary of Unmatched records based on Recovery (Debit and Credit Summary)

Data Source – Input and Output

- Data Source – From the Jpeg Image provided by Oparedo used as Input to Create CSV file format and created output matched and unmatched data into Json Files and loaded in HTML page using Python Flask API methods.

CSV File – Input Data

Loaded into MySQL DB - IINVOICETAB

Processed Output Data, (Matched, Unmatched)

56 Samples

Converted to Data Frame

Loaded to Html using Python Flask API (Front End)

Design Approach

6

Solution Architecture Diagram – High level

Implementation

8
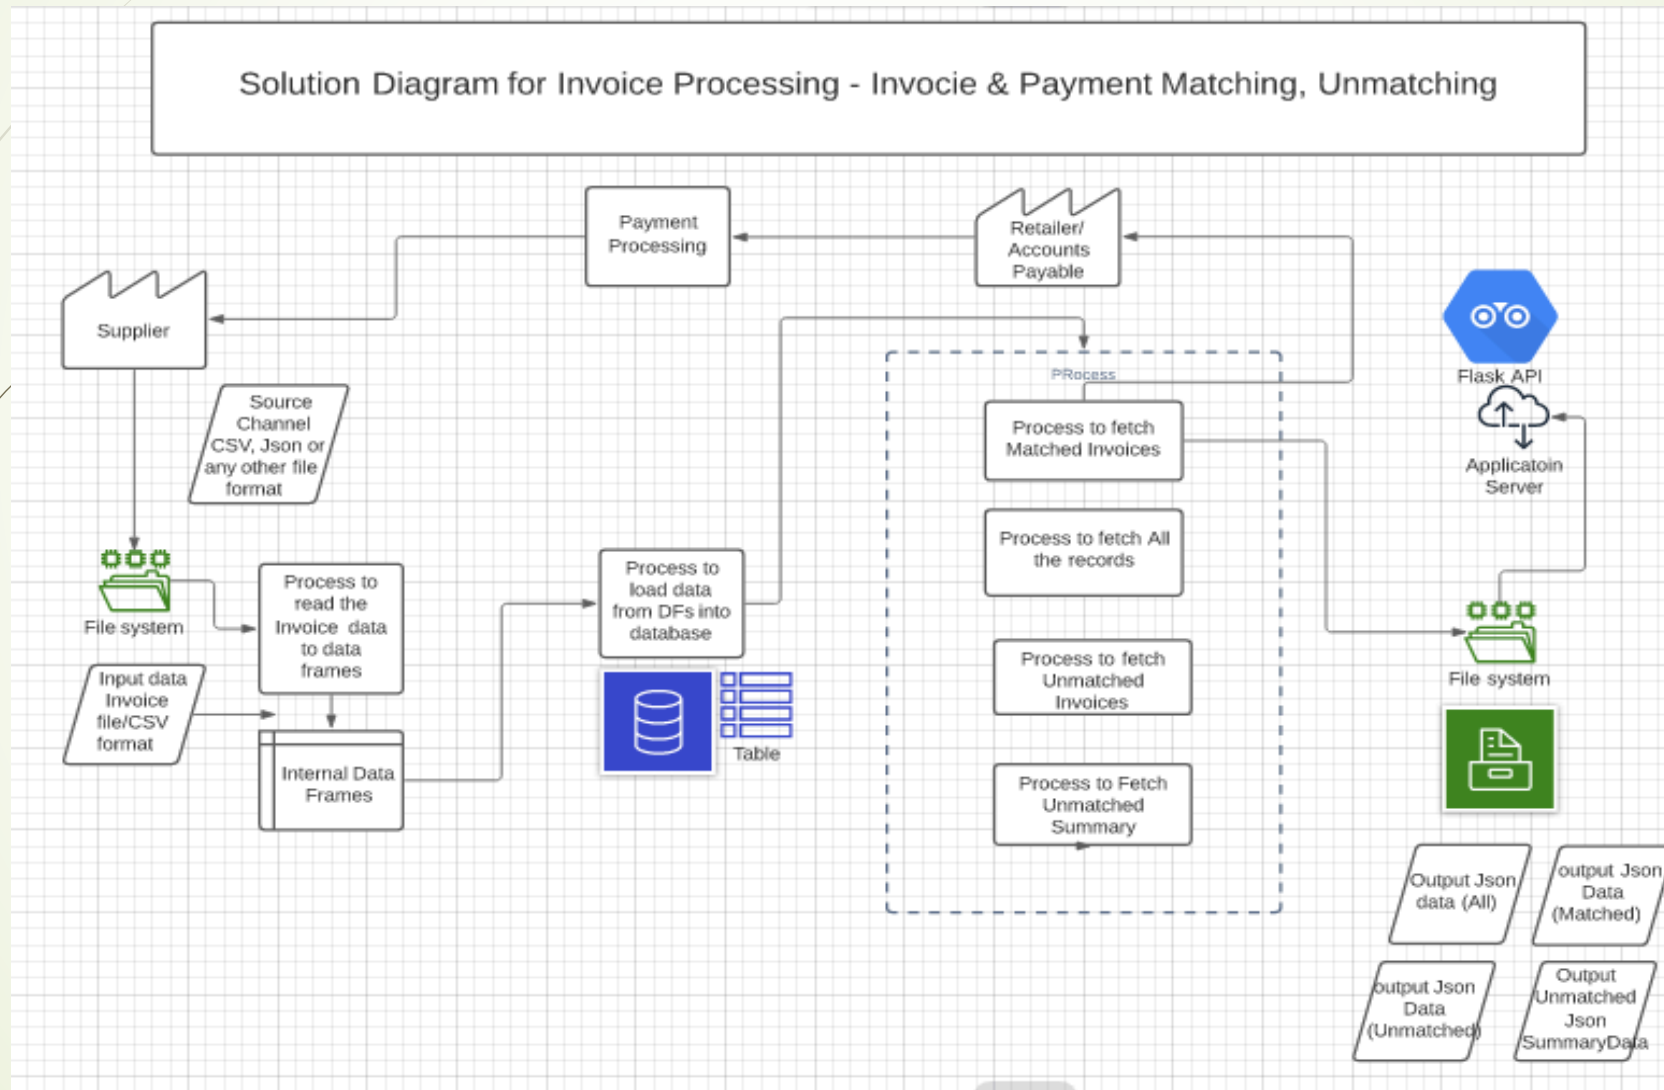

Implementation – Low Level Design

- 2 python scripts – main.py, InvoiceProcess.py
- Packages used:
  - pandas, pymysql, numpy, shutil, os, json, logging, Flask, jsonify, render_template, request, redirect
- Database: mysql
  - Database Name: InvoiceDB
  - Table name: INVOICETAB
- 1 Key class – InvoiceProcess with the methods. List of members and methods
- templates folder used for flask API to load json data into Html page
  - content.html – Home Page
  - Index.html – Index Page
  - AllRecords.html
  - MatchedInvoicesPayment.html
 - UnmatchedInvoices.Payment.html
  - UnmatchedSummary.html

Invoice Processing - Invoice Matching Application

Class Diagram

Main

+ p1 = InvoiceProcess()

InvoiceProcess object calling methods

+ p1.readInfiles()
+ p1.readInfiles()
+ p1.fetch_all()
+ p1.fetch_matchedInvoices()
+ p1.fetch_unMatchedInvoices()
+ p1.fetch_unMatchedSummary()

Flask API methods
+ Index()
+ AllRecords()
+ MatchedInvoices()
+ UnmatchedInvoices()
+ UnmatchedSummary()

InvoiceProcess

+ connection:string = ""
+ logging.basicConfig:string = "InvoiceProcessing.log"

+ __init__(self)
+ connect(self)
+ readInfiles(self)
+ writeOutfile(self)
+ fetch_all(self)
+ fetch_matchedInvoices(self)
+ fetch_unmatchedInvoices(self)
+ fetch_unmatchedSummary(self)

Code & Data Paths – Input/output

- Project Path:
  - ~/PycharmProjects/InvoiceProcessing

  Files: main.py

  InvoiceProcess.py

  Templates:

  Html Files listed in previous page

  Log File:

  InvoiceProcessing.log

- Input:
  - ~/PycharmProjects/input
  - File: CSV File: InvoiceTestData.csv
- Output:
  - Path: ~/PycharmProjects/output
  - Temp Files: Json Files:
    - AllRecords.json
    - MatchedRecords.json
    - UnMatchedInvcRecords.json
    - UnMatchedSumRecords.json

Matched Invoices Page - using python API

- Matched Invoices Page – List of all the Matched Invoices associated based on LETTERING Ids– Rendered using Python Flask API - with POST, GET methods to display in html page.

- URL: Matched Invoices Page:

  - http://127.0.0.1:5000/MatchedInvoices

- Matched Invoices - List of Operations

  - List of All matched Invoices and Payments by Debit and Credit Amounts associated by LETTERING IDs processed from the data retrieved from the database table – INVOICETAB

  - The matched Invoice data pulled from INVOICETAB, converted to Data frame -> Json file -> then rendered the json file to html

Invoice and Payment Records - Matched Invoices,Payment By Debit and Credit Amounts

Back
DEBIT

	LETTERING	DEBIT	CREDIT
0	19.AAAAP	84.0	84.0
1	19.AAAAR	16800.0	16800.0
2	19.AAAAS	2100.0	2100.0

Unmatched Invoices Page – using python API

- Unmatched Invoices Page – List of all the Unmatched Invoices order by RECOVERY – Rendered using Python Flask API - with POST, GET methods to display in html page.

- URL: Unmatched Invoices Page:

  - http://127.0.0.1:5000/UnmatchedInvoices

- Unmatched Invoices- List of Operations

  - List of All Unmatched Invoices and Payments by Debit and Credit Amounts group by Invoice_no order by recovery (Due – Echu , Not Due – Non échu, none/blank), for the data retrieved from the database table – INVOICETAB

  - The data pulled from INVOICETAB, processed using unmatched invoices business logic, converted to Data frame -> Json file -> then rendered the json file to html

17	2020_00017	Not Due	84.0	0.0
18	2020_00018	Not Due	345.6	0.0

Unmatched Summary – using python API

- Unmatched summary Page – List of all the Unmatched summary of records group by RECOVERY – Rendered using Python Flask API - with POST, GET methods to display in html page.

- URL: Unmatched Invoices Page:
  - http://127.0.0.1:5000/UnmatchedSummary

- Unmatched Summary - List of Operations
  - List of All Unmatched summary of Debit and Credit Amounts group by by recovery (Due – Echu , Not Due – Non échu, none/blank) for the data retrieved from the database table – INVOICETAB
  - The data pulled from INVOICETAB, processed using unmatched summary business logic, converted to Data frame -> Json file -> then rendered the json file to html

Invoice and Payment Records - Unmatched Summary of DEBIT & Credit Amounts - Group by Recovery

Back

DEBIT

	RECOVERY	DEBIT	CREDIT
0	Due	9903.6	336.0
1	Not Due	24086.4	0.0
2	nan	122.0	2951.7

Lesson's Learned

Requirement Analysis

- Clearly addressed requirement gaps. – In/out of scope.

- Additional enhancement requirement questions – Data Security, User authentications, Functionality etc

Development Best practices

- Enhanced Standard Implementation practices with the efficient usage of python packages.

- Thorough research and study with the usage of efficient process logic in the implementation to transfer the json data directly into python flask API to get and post the messages to the front-end app.

- Deployment of code in the application server or cloud.

Future Enhancements work:

- Understand any Business process enhancement requirements from the users.

Future Scope

Within Scope

- Matched Invoices

  - Invoice: Debit type transaction
    Payment: Credit type transaction
    Transaction association (lettering) is only done between balanced credit and debit type transactions
    Example:
    Ex:

    - 1 invoice of 10€ and 1 payment of 10€.

    - 2 invoices of 10€ and 1 payment of 20€.

    - 2 invoices of 10€ and 2 payments of 10€.

    - 1 invoice of 10€ and 2 payments of 5€ each

Out of Scope:

- No 30way matching between Order, Invoice, and Payments - Requirement to match only between DEBIT and credit amounts.

- No Invoice detail(line) level matching (SKUs, Quantities etc)

Additional Enhancements Included:

- Unmatched Invoices/payments of Debit & Credit Amounts – Order by Recovery ((Due. - Echu, Not Due – Non-échu, Blank)

- Unmatched Summary of DEBIT & Credit Amounts – Group by Recovery. (Due. - Echu, Not Due – Non-échu, Blank)

Further Enhancements Scope:

This project can be enhanced for future requirements

- This can be enhanced for future requirements like - 3 or 4-Way Matching - If additional details are provided (Order Information, Shipment, Invoice and Payments)

- Matched and Unmatched Detail level Matching (SKUs, and Quantities)

- Multiple Format Input files & sources

- Data Security/User authentication requirements

- Payment processing – Accounts Payable process etc

Thank you
